

Metapopulation reaction-diffusion dynamics

Within-city dynamics (SEIR shown)

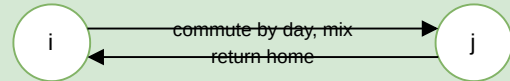

variants: SIS ($I \rightarrow S$), SQIR ($I \rightarrow Q \rightarrow R$), SEIRS ($R \rightarrow S$), SEIQR+D

Diffusive mobility (air, water)

Recurrent mobility (land)

couples force of infection:
 $\pi_i = \sum_j C_{ij} \cdot I_j^* / N_j$

Each day: local reaction, then network mobility

With no land layer, $C = I$ and $\pi_i = I_i / N_i$ (plain diffusive coupling).
